Depictions of Physical Order: A Brief Look at Diagrams in Late Medieval English Medical Manuscripts

by Sara Öberg Strådal

1000 Worte Forschung: *Dissertation, History of Art, University of Glasgow, completed in January 2015*

In my thesis, I positioned diagrams – such as uroscopy charts, humoral *rotæ*, volvelles, the spheres of the universe, *mappæ mundi*, lunation diagrams, Zodiac Man, Phlebotomy Man, Wound Man and Disease Woman – included in medical manuscripts, within a larger visual and cultural framework. When considering devotional or religious art, scholars often study the multiple reasons for its creation, reproduction and distribution.¹ Conversely, when discussing scientific diagrams and illustrations, many historians consider their ubiquitous presence as evidence primarily of their practical function.² I argue that the diagrams included in medical manuscripts can provide insights into late medieval social beliefs and medical practices. I argue that artists and compilers chose and reproduced diagrams for multiple reasons well beyond the practical.

But what is a diagram? And how are they different from other illustrations? Well, there are no formal features or characteristics that apply to all medieval diagrams. Symmetry, however, is the most common characteristic and is central to most types of diagrammatic renderings.³ In some examples, the intellectual content is expressed through the human form while other diagrams are based on geometric shapes. Diagrams describing Christian theological ideas have been examined by modern art historians.⁴ For example, Ann Esmeijer considers the intersection

between diagrammatic representations and Scripture during the medieval period. She argues that the use of harmonious and continual cosmological diagrams may have arisen within Christian writing to express Christian theological concerns.⁵ I believe that this kind of consideration and crucial appraisal of diagrams included in medical sources can yield insights into complex medical, theological and social discourses. The definition of *diagram* originates not within the formal features of the schema, but within its function.⁶ An illustration of a plant can be either life-like or abstract, whereas a diagram of the same organism must necessarily *explain* a feature or purpose.

To undertake a meaningful discussion it was necessary to establish a somewhat representative corpus and to structure this diverse material in meaningful ways. The manuscripts included in this thesis were chosen based on their audiences. Because illustrated manuscripts from the Middle Ages originate primarily within the higher echelons society, it is not possible to claim that the audiences of these schemas include the entire spectrum of medical practitioners. I nevertheless attempted to include manuscripts owned and used by educated laypersons, university educated practitioners, surgeons, and barber surgeons. This allowed me to compare the diagrams and illustrations included in the Guild Book of the Barber Surgeons of York to the schemas included in a codex used by a practicing uroscoper, and investigate their varied appearance in relationship to the social functions the diagrams fulfilled.⁷

The intellectual content of these medical diagrams, rather than their formal features, influenced the structure of the thesis. By grouping material according to their function or content, visually distinct diagrams were positioned within the same categories,

allowing for closer consideration of schemas produced for different audiences. Humoral theory, while perhaps not as influential to medical practice as previously believed, was frequently illustrated in medical treatises. The very notion of health was closely connected to the perceived balance within the human body.⁸

These medical theories provide the framework for organising this expansive field of visual material and the content of this thesis, which was structured according to contemporary humoral conventions. The first chapter considered diagrams describing the humoral balance of the human body. Schemas that explain the external influences on this physical equilibrium were discussed in the second section. Lastly, in the final chapter I discussed depictions of cosmic influences on the internal microcosm as mapped on the human body.

Through text-image analysis, by considering the diagrams in relationship to the texts that immediately surround them and the other texts included within the same codex, I have shown that diagrams, through different means, emphasised or legitimized the surrounding texts and medical practices. Additional analysis was inter pictorial: the visual motifs are considered in relationship to similar and related pictorial subjects, familiar from other manuscripts and artistic contexts. Through consideration of the intervisual references to devotional art and other scientific schemas, the multiple meanings of the medical diagrams were further elucidated. Another feature of the codices studied is their status as physical objects, how they were held, used, leafed through and transported. Lastly, by situating the codices and their diagrams within a late medieval English social, ideological and religious milieu, a deeper understanding of their function was achieved. Rather than being simple tools used in medical practice or representations of medical theories, diagrams included in medical manuscripts functioned in multiple, prescriptive and descriptive, ways to define theological, civic and gendered ideas around social order.
